

myritmo

Your cardiologist now just a click away.

Las Vegas, 7 January 2025: Withings, the leading provider of digital health monitoring, announces its cooperation with myritmo at CES. myritmo is now directly integrated into the Withings app.

This means that millions of Withings customers in Germany and France can now send their ECG to myritmo's cardiologists with just one click. And receive the medical assessment and their personalised report the very next working day.

'We are thus revolutionizing the healthcare market and providing the fastest possible certainty as to how an ECG recording from a smart device is medically assessed,' says Co-CEO Dr Philip Nölling.

The Withings and myritmo integration is a game-changing development in the cardiovascular space - as Atrial Fibrillation, a form of irregular heart rhythm can now be diagnosed much earlier. This new service is compatible with all current and future Withings devices that have ECG functionality.

The new service will initially be launched in Germany and France and will soon be available in other countries. Users of digital SmartDevices from other manufacturers can continue to simply send their ECG by email to cardio@myritmo.de and receive their personalised Cardio-Check within one working day.

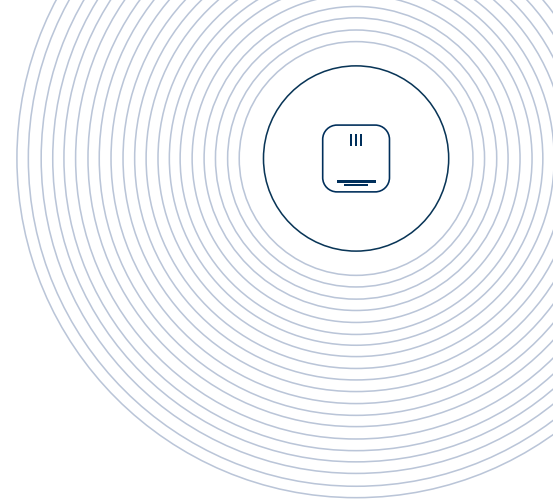

'We are proud to be the medical partner of Withings and to be able to help Withings users better understand their heart health,' says Dr Philip Nölling.

'If we detect any abnormalities, we offer further medical clarification with our doctors and our myritmo system. This means that every Withings customer can be sure that they have done the best for their heart health,' explains Dr Stephan Kranz, Medical Director and Co-CEO.

The partnership between Withings and myritmo is a new step in the world of consumer devices to improve people's heart health quickly, easily and safely.

myritmo

myritmo is a product of dpv-analytics, which was founded in 2018 as a spin-off of the renowned Cardiologicum by three Hamburg doctors with the vision of setting new standards in heart and stroke prevention. In line with the motto 'Prevention instead of treatment', they developed the ritmo mini ECG, which was honoured with the German Medical Award as the most innovative medical product of 2021. The ritmo can be used to minimise the risk of a stroke, for example. This is made possible by the all-round service offering consisting of the modern, wireless mini ECG, AI-controlled software and a cardiologist network. The mini ECG is extremely comfortable to wear, the ECG data is analysed as quickly as possible and with the highest accuracy by the AI software and also validated by a cardiologist. The award-winning ritmo makes preventive and medical care for patients and doctors alike simple, fast and possible from anywhere, without the need to purchase expensive hardware and software. Both the mini ECG and the software are 'Made in Germany' and are certified and approved throughout the EU as a Class IIa medical device.
